Using the Filter Effects dialog box Photoshop also includes the Filter Effects dialog box (refer to Figure 2-2) for applying the most commonly used effects and filters.

You can use the Filter Effects dialog box for effects that don't have the added flexibility of blending. You have two Filter Types to choose from when applying the effects: \* \*\*Distort:\*\*

Distort applies a graduated filter that simulates the ripple or spray of water or the surface of sand. This

---

effect softens hard edges or adds visual noise. The amount of softening or noise you see depends on the slider you use. You can only apply this effect to a layer. \*

**\*\*Transparency:\*\*** Transparency effects the colors of one layer against the colors of another.

Choose this filter type for a specialized filter that masks out part of an image. To apply a transparency filter, use the Rectangular or Elliptical Marquee tool to select the area you want to mask. Use the Masks option at the bottom of the dialog box to apply the filter. You can control the percentage of the selected area that is transparent by using the slider, as shown in Figure 2-3. **FIGURE 2-3:** You can control the percentage of

---

an image area that's transparent by using the slider. As with most Photoshop adjustments, a slightly darker image is normal. If the masking portion of the image is clearly darker than the original image area, desaturate the masking portion of the image. ## App

The table below gives a comparison of the features of Photoshop Elements with Photoshop:  
Supported features in Photoshop Elements 12 Free Download |  
Rating : In this article, we are showing all the tools available for creating incredible creative effects in Photoshop. Effect Tools In Photoshop, we often need to work

---

on the penultimate, or last layer, which is as it is called in the UI. If you want to switch easily between the penultimate layer, you have to undo the current layer. All we need to do is to create a “copy of the selection” (Cmd/Ctrl + Shift + C/Ctrl + I) and then Ctrl + Z, to put the previous layer as a new layer above the current. This is very handy when you want to share the design with other designers. Do you want to learn how to turn the penultimate layer into a new layer? You can turn a layer into a new layer by choosing “Dissolve” while holding shift. Let’s see how to convert your current layer into a new one: Step 1. Open the Layers Palette Open the Layers palette and select the current layer. Step 2.

---

Choose “Dissolve” While holding shift, choose “Dissolve” from the Layers menu and click OK. Our selected layer will be transformed into a new layer. How do I easily merge two layers? In Photoshop, we can merge two layers by using the “merge” tool, by simply selecting the layer from which you want to merge and dragging on the other layer. In the Photoshop Elements, you cannot merge two layers easily. To merge two layers, you will need to do it manually. Luckily, you can merge two layers simply by clicking on the top layer, then holding the shift key, and then click on the bottom layer. Step 1. Select the top layer Click on the top layer by right clicking on its name from the Layers Palette. You

---

need to choose “layers” from the submenu of the right click menu.

Step 2. Hold the shift key Hold the shift key and click on the bottom layer (the one you want to merge).

Step 3. Click on the bottom layer

Once you have clicked on the bottom layer, 05a79cecff
